

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for remote execution of software, comprising:
installing executable code on a management device;
communicatively coupling said management device to a remote system;
at said remote system, creating by said management device a class object,
wherein said class object is compatible with a Win32 Process class object;
at said remote system, executing by said management device a create
method with a path to said executable code on said management device
as an argument; and
executing at said remote system said executable code residing on said
management device ~~locally on said remote system.~~
2. (Currently Amended) The method of Claim 1 further comprising
~~instanciating~~ instantiating an object on said remote system which calls
said executable code residing on said management device.
3. (Currently Amended) The method of Claim 2, wherein a device
manager of said management device ~~instanciates~~ instantiates said
object using Windows Management Instrumentation software.
4. (Original) The method of Claim 2 further comprising launching said
executable code on said management device.

5. (Original) The method of Claim 4 further comprising starting and finishing said executable code by said remote system.
6. (Currently Amended) The method of Claim 1 further comprising:
installing an application ~~and an uninstall executable code~~ on said remote system; and
running ~~said~~ an uninstall executable code on said remote system as directed by a device manager of said management device.
7. (Currently Amended) The method of Claim 6, wherein said uninstall executable code is started on said remote system by ~~instanciating~~ instantiating and executing a Windows Management Instrumentation object.
8. (Original) The method of Claim 7, wherein said object comprises a CreateProcess object.
9. (Currently Amended) The method of Claim 6 further comprising:
communicatively coupling to a system/root/cimv2 space of said remote system;
at said remote system, creating a Win32_Process class object; and
at said remote system, executing said ~~Win32_Process class object~~ a
Win32_Process->Create method with a path to said uninstall executable code on said management device as an argument.
10. (Original) The method of Claim 1 further comprising the step of
implementing a Web Based Enterprise Management (WBEM)
standard to facilitate said remote execution of software.
11. (Currently Amended) A method of remote execution of software
between a server and a client using Windows Management
Instrumentation (WMI) software, comprising:

installing executable code on said server;

installing said WMI software on said client;

a device manager of said server performing:

a) accessing a system\root\cimv2 space of said client;

b) at said client, creating a Win32_Process class object;

c) at said client, executing a Win32_Process->Create method with a path to said executable code on said server as an argument; and executing at said client said executable code residing on said server ~~by said client, wherein said executable code is executed locally on said client.~~

12. (Currently Amended) A client-server system, comprising:

a server having a device manager that ~~instanciates~~ instantiates an object at a client, ~~which wherein said object is used by said client to call an executable residing on said server; and~~

a said client coupled to said server having said ~~object~~ executable, wherein once said object calls said executable ~~called~~, said executable is launched on said client ~~once called~~ and said executable starts and finishes remotely on said client.

13. (Currently Amended) The client-server system of Claim 12, wherein said device manager of said server ~~instanciates~~ instantiates a Windows Management Instrumentation (WMI) CreateProcess object on said client, and wherein said device manager accesses a system\root\cimv2 space of said client and creates a Win32_Process class object.

14. (Currently Amended) The client-server system of Claim 13, wherein said device manager ~~accesses a system\root\cimv2 space of said client, creates a Win32_Process class object, and~~ executes a Win32_Process->Create method with a path to said executable code on said server as an argument.

15. (Currently Amended) A method for remote uninstallation of software, comprising:
installing an application and an uninstall executable code on a remote system over a network connection; and
running ~~said~~ an uninstall executable code on said remote system as directed by a device manager running on a management device, wherein
said running said uninstall executable code comprises:
accessing a system\root\cimv2 space of said remote system, and
at said remote system, creating a Win32 Process class object.
16. (Currently Amended) The method of Claim 15 further comprising starting said uninstall executable code on said remote system by ~~instanciating and executing a Windows Management Instrumentation object~~ executing a Win32 Process->Create method with a path to said uninstall executable code for uninstall on said management device as an argument.
17. (Currently Amended) The method of Claim ~~16~~ 15, wherein said ~~object comprises a CreateProcess object~~ Win32 Process class object is a Windows Management Instrumentation class object.
18. (Currently Amended) A method for remote uninstallation of software between a server and a client using Windows Management Instrumentation (WMI) software, comprising:
loading executable code for uninstall of an application during initial installation of said application on said client
installing said WMI software on said client;
a device manager of said server performing:
a) accessing a system\root\cimv2 space of said client;
b) at said client, creating a Win32_Process class object;

c) at said client, executing a Win32_Process->Create method with a path to said executable code for uninstall on said server as an argument, wherein said application is remotely uninstalled.

19. (Currently Amended) A client-server system, comprising:
a server having a device manager which installs applications and uninstall executable code on client computers over a network connection; and
a client computer coupled to said server which runs said uninstall executable code as directed by said device manager, wherein said device manager accesses a system\root\cimv2 space of said client computer and creates a Win32_Process class object at said client computer.

20. (Currently Amended) The client-server system of Claim ~~18~~ 19, wherein said device manager starts said uninstall executable code on said client computer by ~~instanciating~~ instantiating and executing a Windows Management Instrumentation object.

21. (Currently Amended) The client-server system of Claim ~~20~~ 19, wherein said device manager ~~accesses a system\root\cimv2 space of said client computer, creates a Win32_Process class object, and~~ executes a Win32_Process->Create method with a path to said executable code for uninstall on said server as an argument, wherein said application is remotely uninstalled.

22. (Currently Amended) The client-server system of Claim ~~18~~ 19, wherein a Web Based Enterprise Management (WBEM) standard is used to facilitate remote uninstall of software.
